Database Systems

4 April 2016

### Lab #9

1. Person Table: PID → FirstName, LastName, PhoneNumber, Address

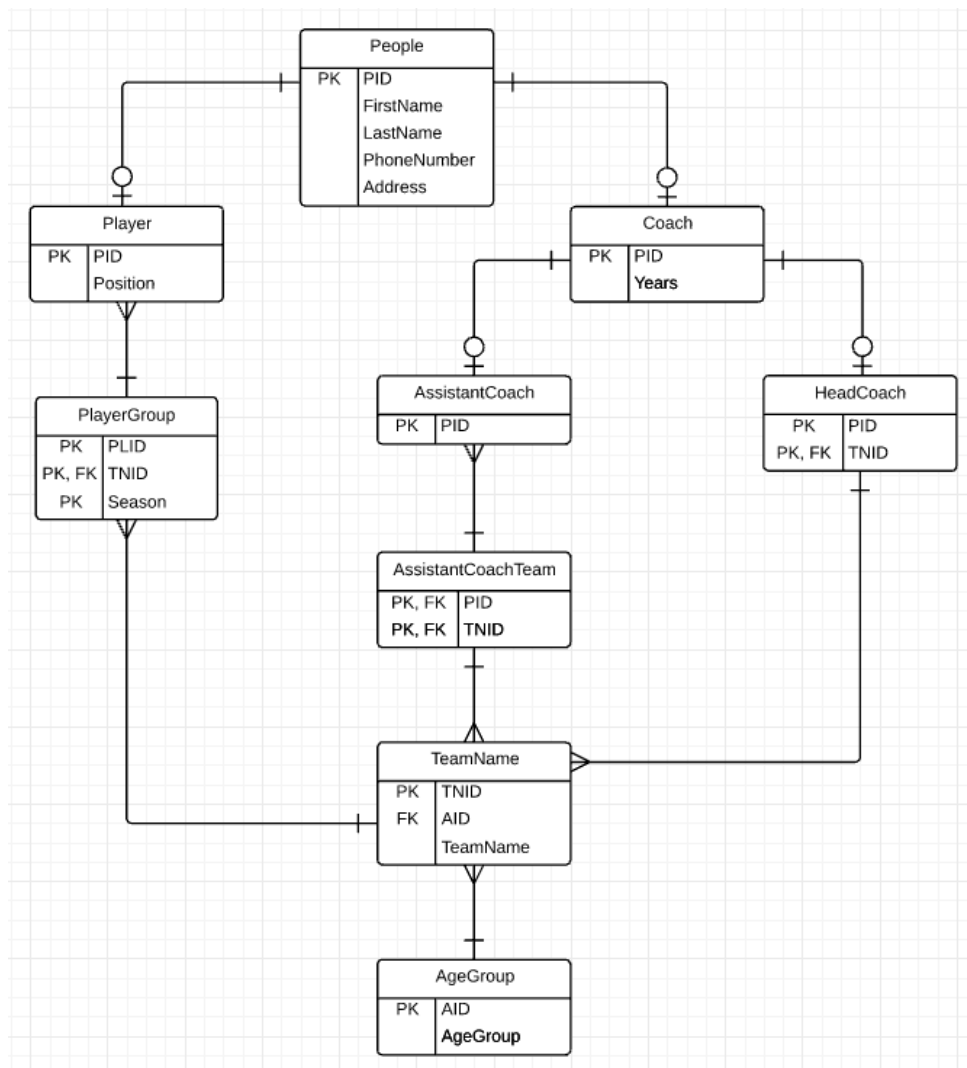

Player Table: PID → Position

Coach Table: PID → Years

TeamName Table: TNID → TeamName

AgeGroup Table: AID → AgeGroup

2.

3. My database is in 3NF. The reason first and foremost is that the database is in 1NF and 2NF. The data base has a tree like structure and all data types are unique. All primary keys are unique and all unique columns or non keys depend on a singular unique primary key and nothing else. No primary key is the same as another primary key in the database.
